- **Implicit Aspect Grounding**

Case: service → trigger "valet" → opinion "rude" ⟹ negative

Retrieved evidence from the knowledge base

The list go on: a rude and discourteous valet, have to call for housekeeping at 3:30 in the afternoon because the room have not be clean, have to call for toilet paper, short-circuit iron, short-handed bar staff, take 30 minute to get my car out of valet at check-out.

Opinion grounding

Fine-grained role cue

Note: Target aspect word → service is implicit;
Retrieval → service grounding explicit.

- **Distinction between Related Aspects**

Case: room → trigger "fridge key would not work" → opinion "would not work" score=0.1917 ⟹ negative ×

check-in → trigger "key card do not work" → opinion "key card do not work" score=0.8263 ⟹ negative √

Competing retrieved evidence with ranked scores

when we get to the room, we key card would not work on the door.

Ranking favors the more consistent aspect match

Note: The higher score suppresses the weaker room hypothesis and keeps the prediction aligned with the check-in aspect.

- **Polarity Disambiguation under Mixed Opinions**

Case: service → trigger "hotel staff" → opinion "could not care less" ⟹ negative

service → trigger "bell desk staff" → opinion "very good" ⟹ positive

service → trigger "shuttle driver" → opinion "go out of they way to give we a ride" ⟹ positive

Retrieved evidence that separates conflicting service cues

Negative Fragment

#1: *hotel be sell out and the staff could not handle that.*

Positive Fragments

#2: *the bell staff, transportation desk and front desk be over friendly and helpful.*

#3: *the driver of free shuttle be prompt and friendly.*

Conflicting service evidence

Aspect-compatible retrieval separates polarity

Note: The same review contains both positive and negative service evidence. Retrieval provides aspect-compatible opinion phrases that separate the conflicting cues.

- **Cross-sentence Evidence Aggregation**

Case: *"the advertised rate be 69 dollar a night for friday, saturday and sunday night."* ⟹ [init] positive

value → trigger "service charge" → opinion "customary charge" ⟹ negative

Aggregating value evidence across the review

[Frag 1]: *the advertised rate be 69 dollar a night for friday, saturday and sunday night.*

[Frag 2]: *we check out electronically, and we reciept be for 450 dollar, and have quote totally wrong price for each night.*

[Frag 3]: *we even show the clerk we confirmation that quote the price we would be pay.*

[Frag 4]: *that be pretty much b, since you can not charge someone more for a service once they have book it.*

Later fragments override the first cue

Note: The value judgment only becomes clear after aggregating several fragments about the advertised rate, the wrong receipt, and the final overcharge.
